

Week 8
25th June, 2022

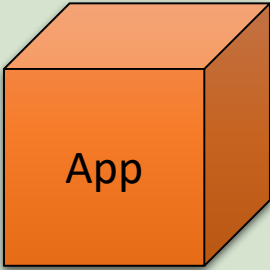

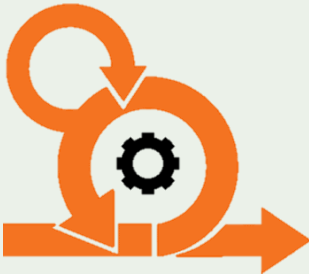

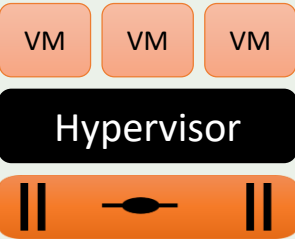

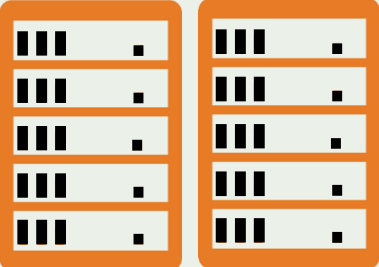

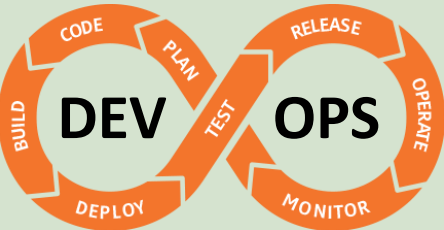

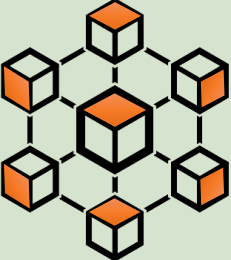

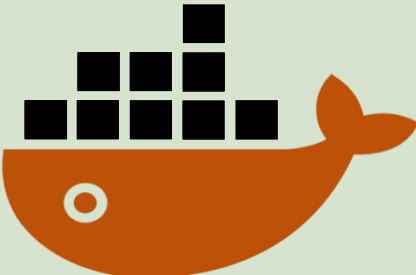

Agenda

1. Microservices and Serverless
2. Microservices - The Hard Parts
- James
3. You are a Solutions Architect and a start-up has asked your guidance on which database to choose. What will you advise?
- Prasad

How applications evolved?

TimeLine	Development Process	Application Architecture	Deployment & Packaging	Application Hosting Infrastructure
1980 to 2000	 <p>Waterfall</p>	 <p>Monolithic</p>	 <p>Physical Server</p>	 <p>Datacenter</p>
2000 to 2010	 <p>Agile</p>	 <p>N-Tier</p>	 <p>Virtual Servers</p>	 <p>Hosted</p>
2010 to Current	 <p>DevOps</p>	 <p>Microservices</p>	 <p>Containers</p>	 <p>Cloud</p>

Monolith vs Microservices

A food stall vs. a Pizza place

VS.

A food stall vs. a fine dining restaurant

VS.

What is a Monolith Application?

- One large system and is usually one code-base
- Built as a single and indivisible unit
- Designed without modularity
- Deployed all at once
- Components depend on each other to work

Monolith Challenges

- Barrier to adopting new technologies
- Continuous deployment is difficult
- Complex / large code base
- Difficult to scale
- Difficult to maintain

What Are Microservices?

- Applications composed of independent services that communicate over well-defined APIs

Monolithic Architecture

Microservice Architecture

MonolithFirst Approach

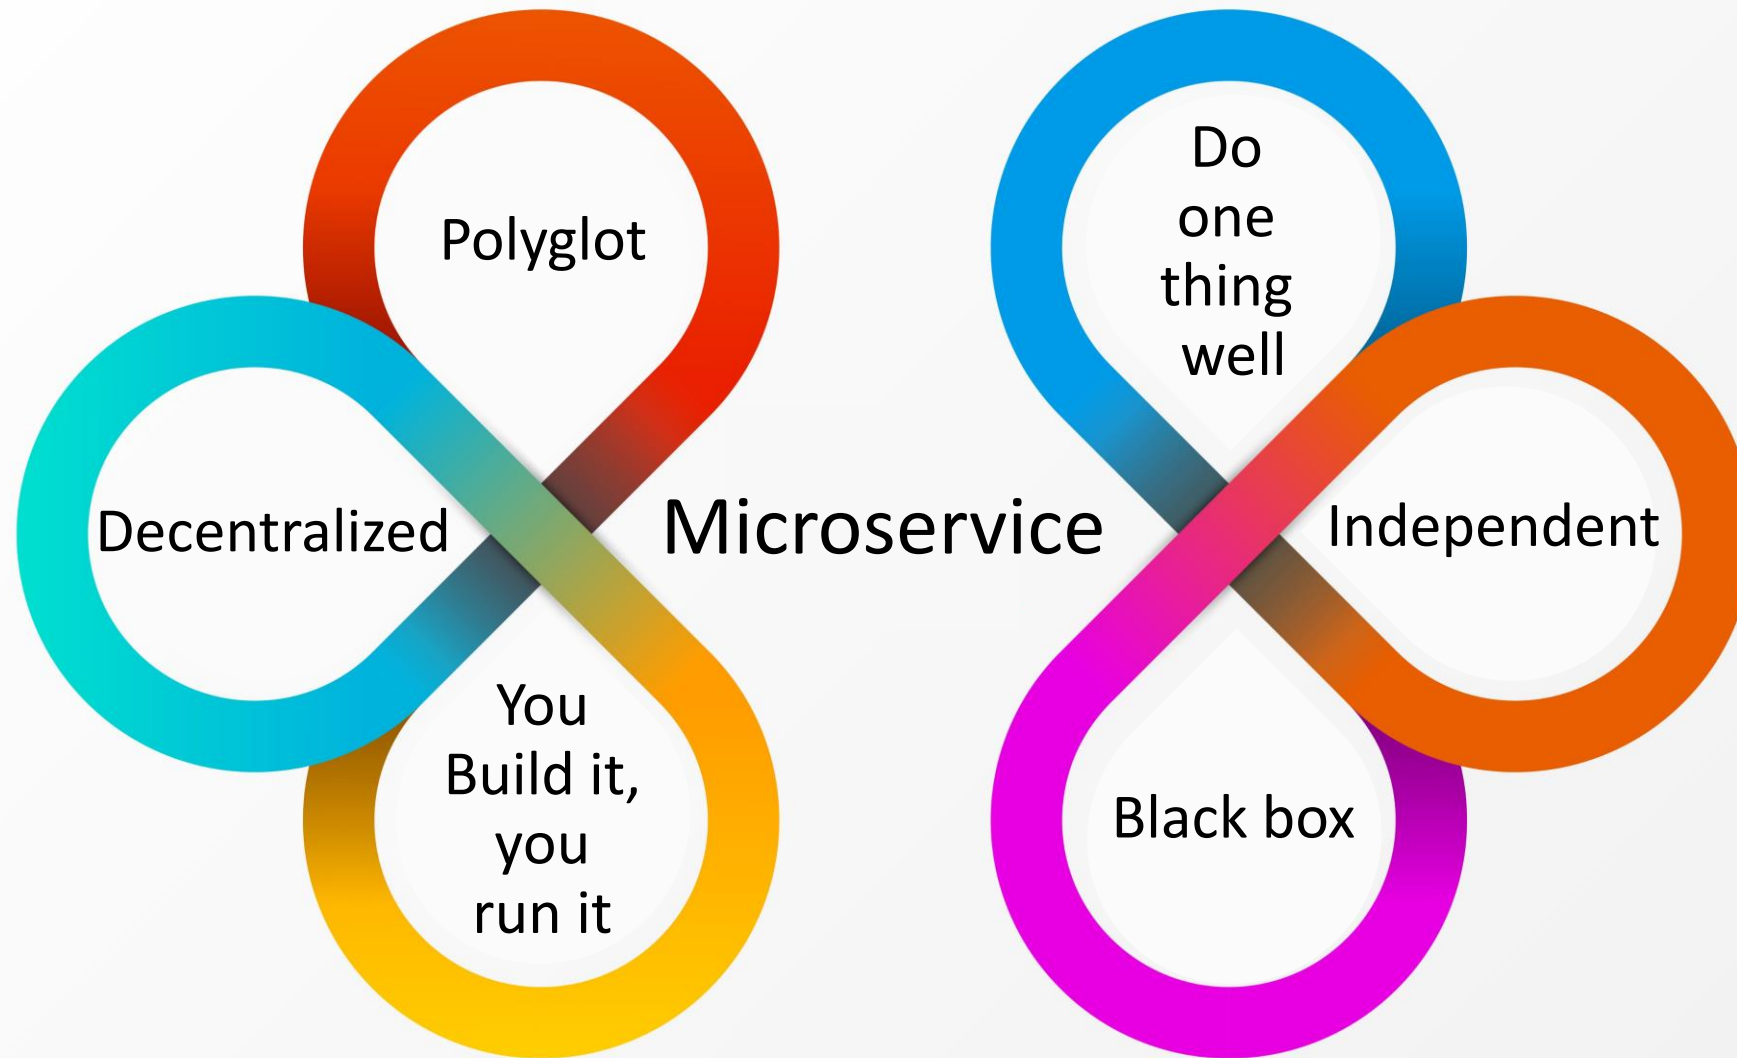

3 June 2015

Ref: <https://martinfowler.com/bliki/MonolithFirst.html>

Martin Fowler

Characteristics of a Microservice

Do you see anything common in these wheels?

The interface is same

So any wheel can be attached

Become a Solutions Architect

Serverless Architecture

AWS Lambda

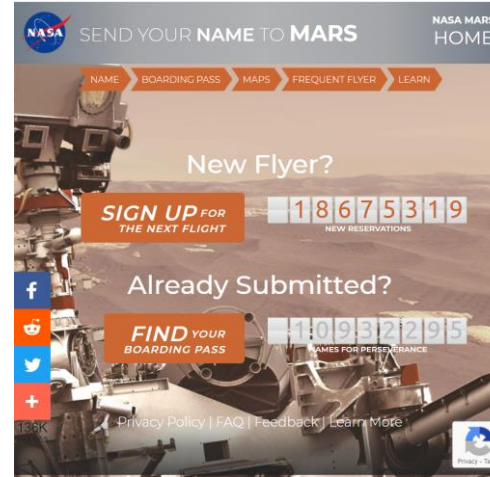

Amazon API Gateway

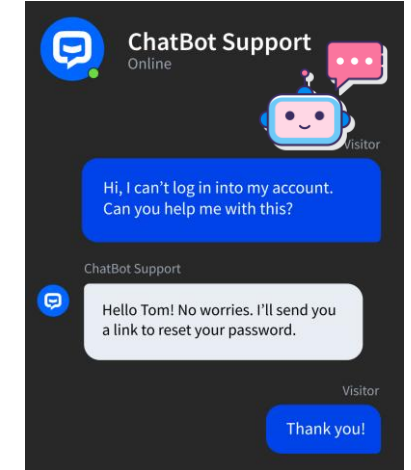

Why serverless?

Web Applications

ChatBots

24 x 7
Operations

24 x 7 Running Backend
Executes some code

- Mostly idle
- Costing Money
- Operational overhead

Some Serverless Services on AWS

Compute

AWS
Lambda

AWS
Fargate

API Proxy

Amazon
API Gateway

Database

Amazon
DynamoDB

Amazon
Aurora

Inter-process Messaging

Amazon
SNS

Amazon
SQS

Orchestration

AWS Step
Functions

Storage

Amazon
S3

Analytics

Amazon
Kinesis

Amazon
Athena

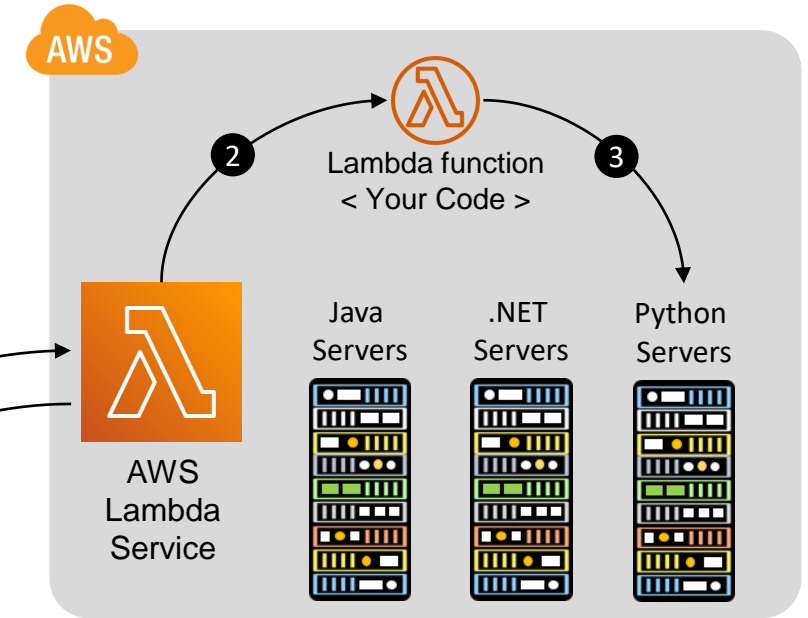

AWS Lambda

How AWS Lambda works?

1. An event is triggered from frontend (Click / API Call / Fingerprint scan etc.)
2. AWS Lambda Service receives invocation call and triggers corresponding Lambda function
3. Code inside the Lambda function is executed in a suitable environment
4. (Optional) Results are delivered back to the frontend

Advantages

- No servers to manage
- Millisecond billing
- Automatic scaling
- Rich ecosystem

Limitations

- Max 15 Min Duration
- Max 10 GB RAM
- Stateless execution
- Potential Cold Start

AWS Lambda Function Execution

Lambda Resources

- <https://aws.amazon.com/lambda/resources>

Tutorials

Below you will find step-by-step tutorials on getting started with building your first serverless application. To see more AWS Lambda tutorials, visit our [workshops & tutorials](#) page.

Create a hello world Lambda function

In this tutorial, you will learn the basics of running code on AWS Lambda without provisioning or managing servers.

Everything done in this tutorial is Free Tier eligible.

Serverless data processing workshop

In this learning path, you'll deploy a simple web application that enables users to request unicorn rides from the Wild Rydes fleet.

Deploying it through SAM

- <https://github.com/aws-samples/cookiecutter-aws-sam-s3-rekognition-dynamodb-python>

Cookiecutter AWS Sam S3 Rekognition Dynamodb Python

This repository contains a cookiecutter template you can use to initialize a AWS Serverless Application Model (SAM) app that uses AWS Rekognition APIs to detect text in S3 Objects and stores the text in DynamoDB.

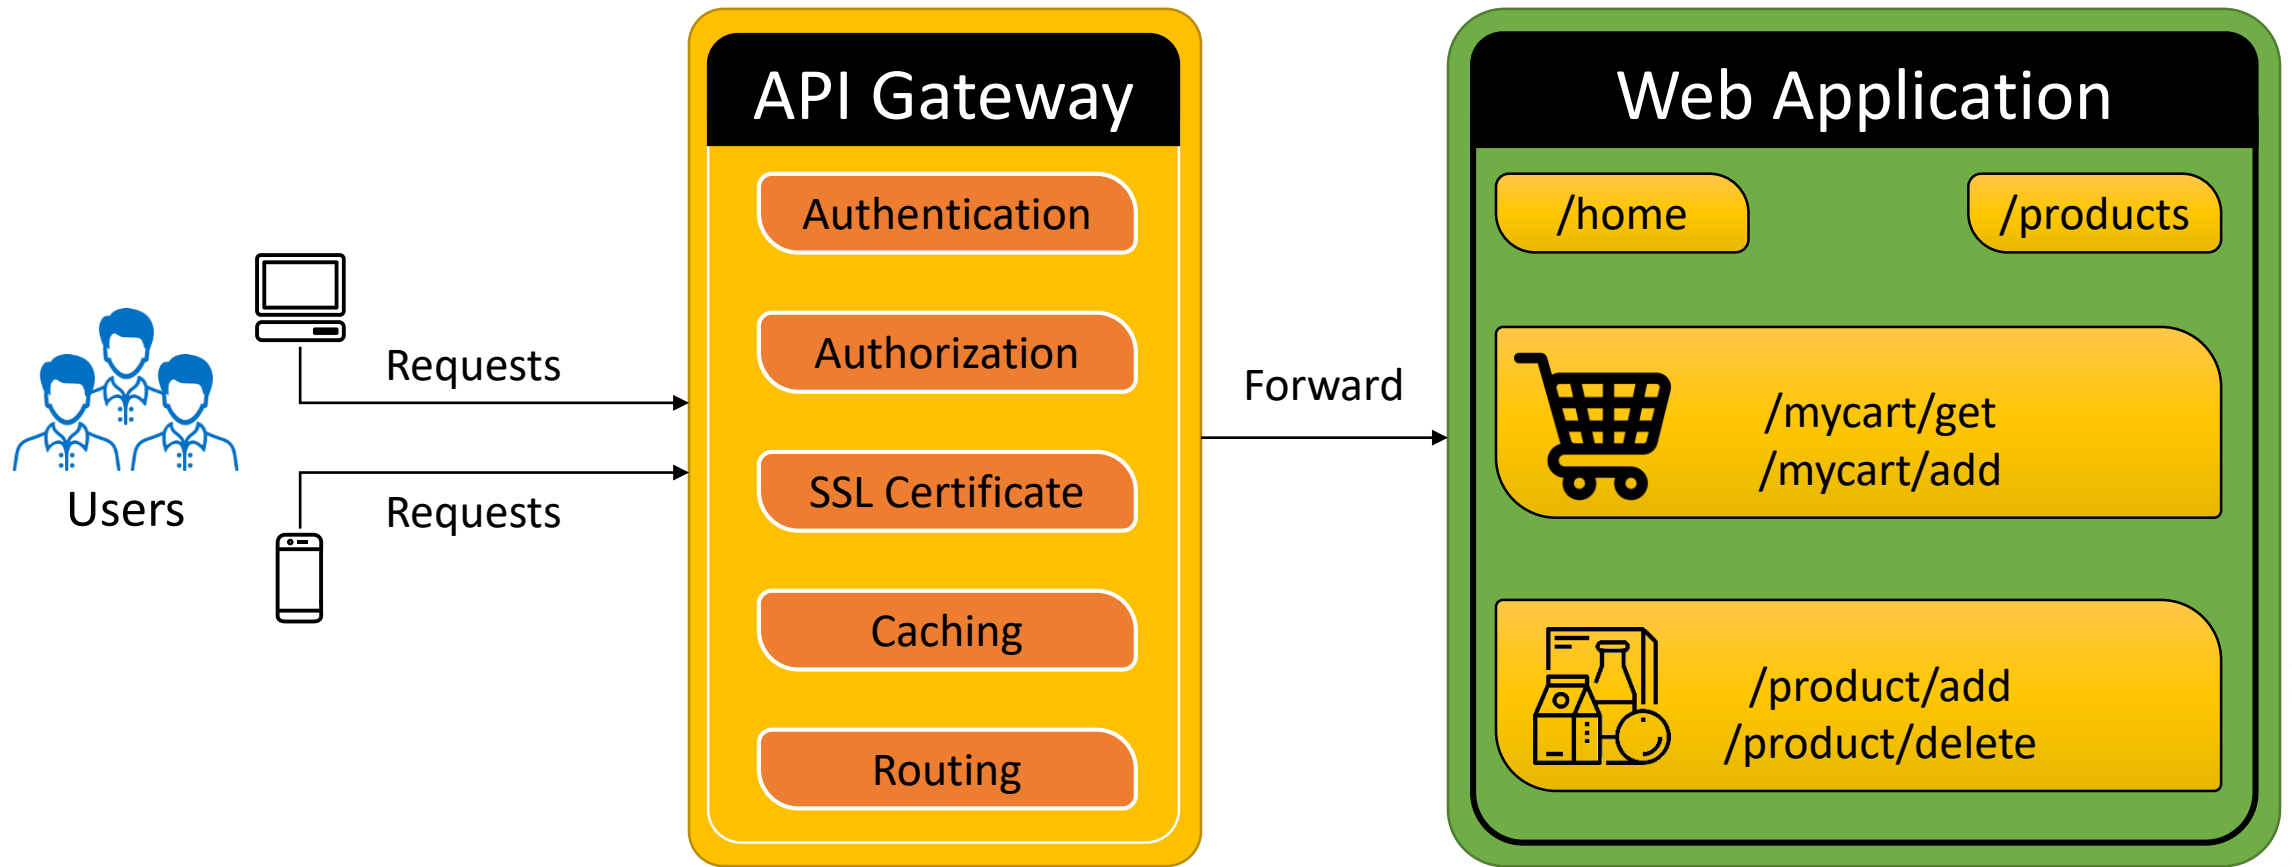

Amazon API Gateway

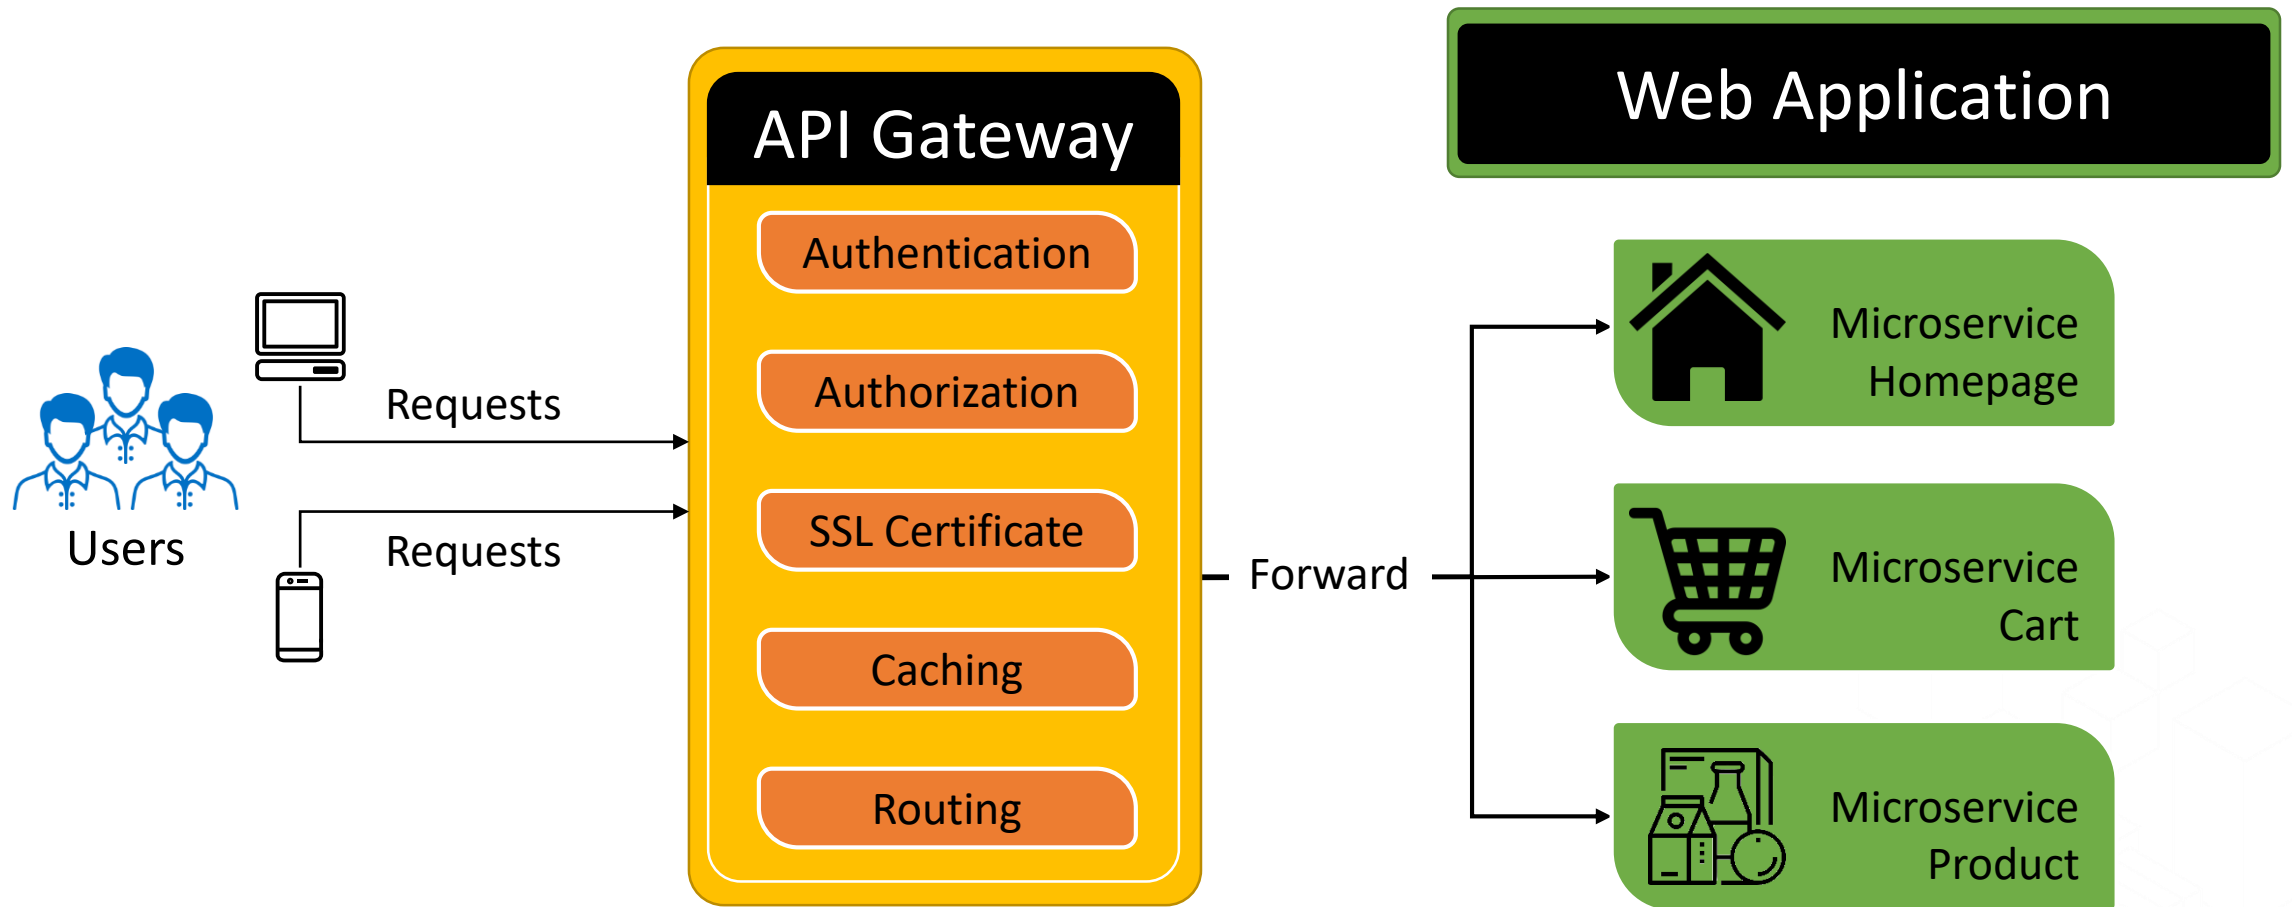

E-Commerce Application

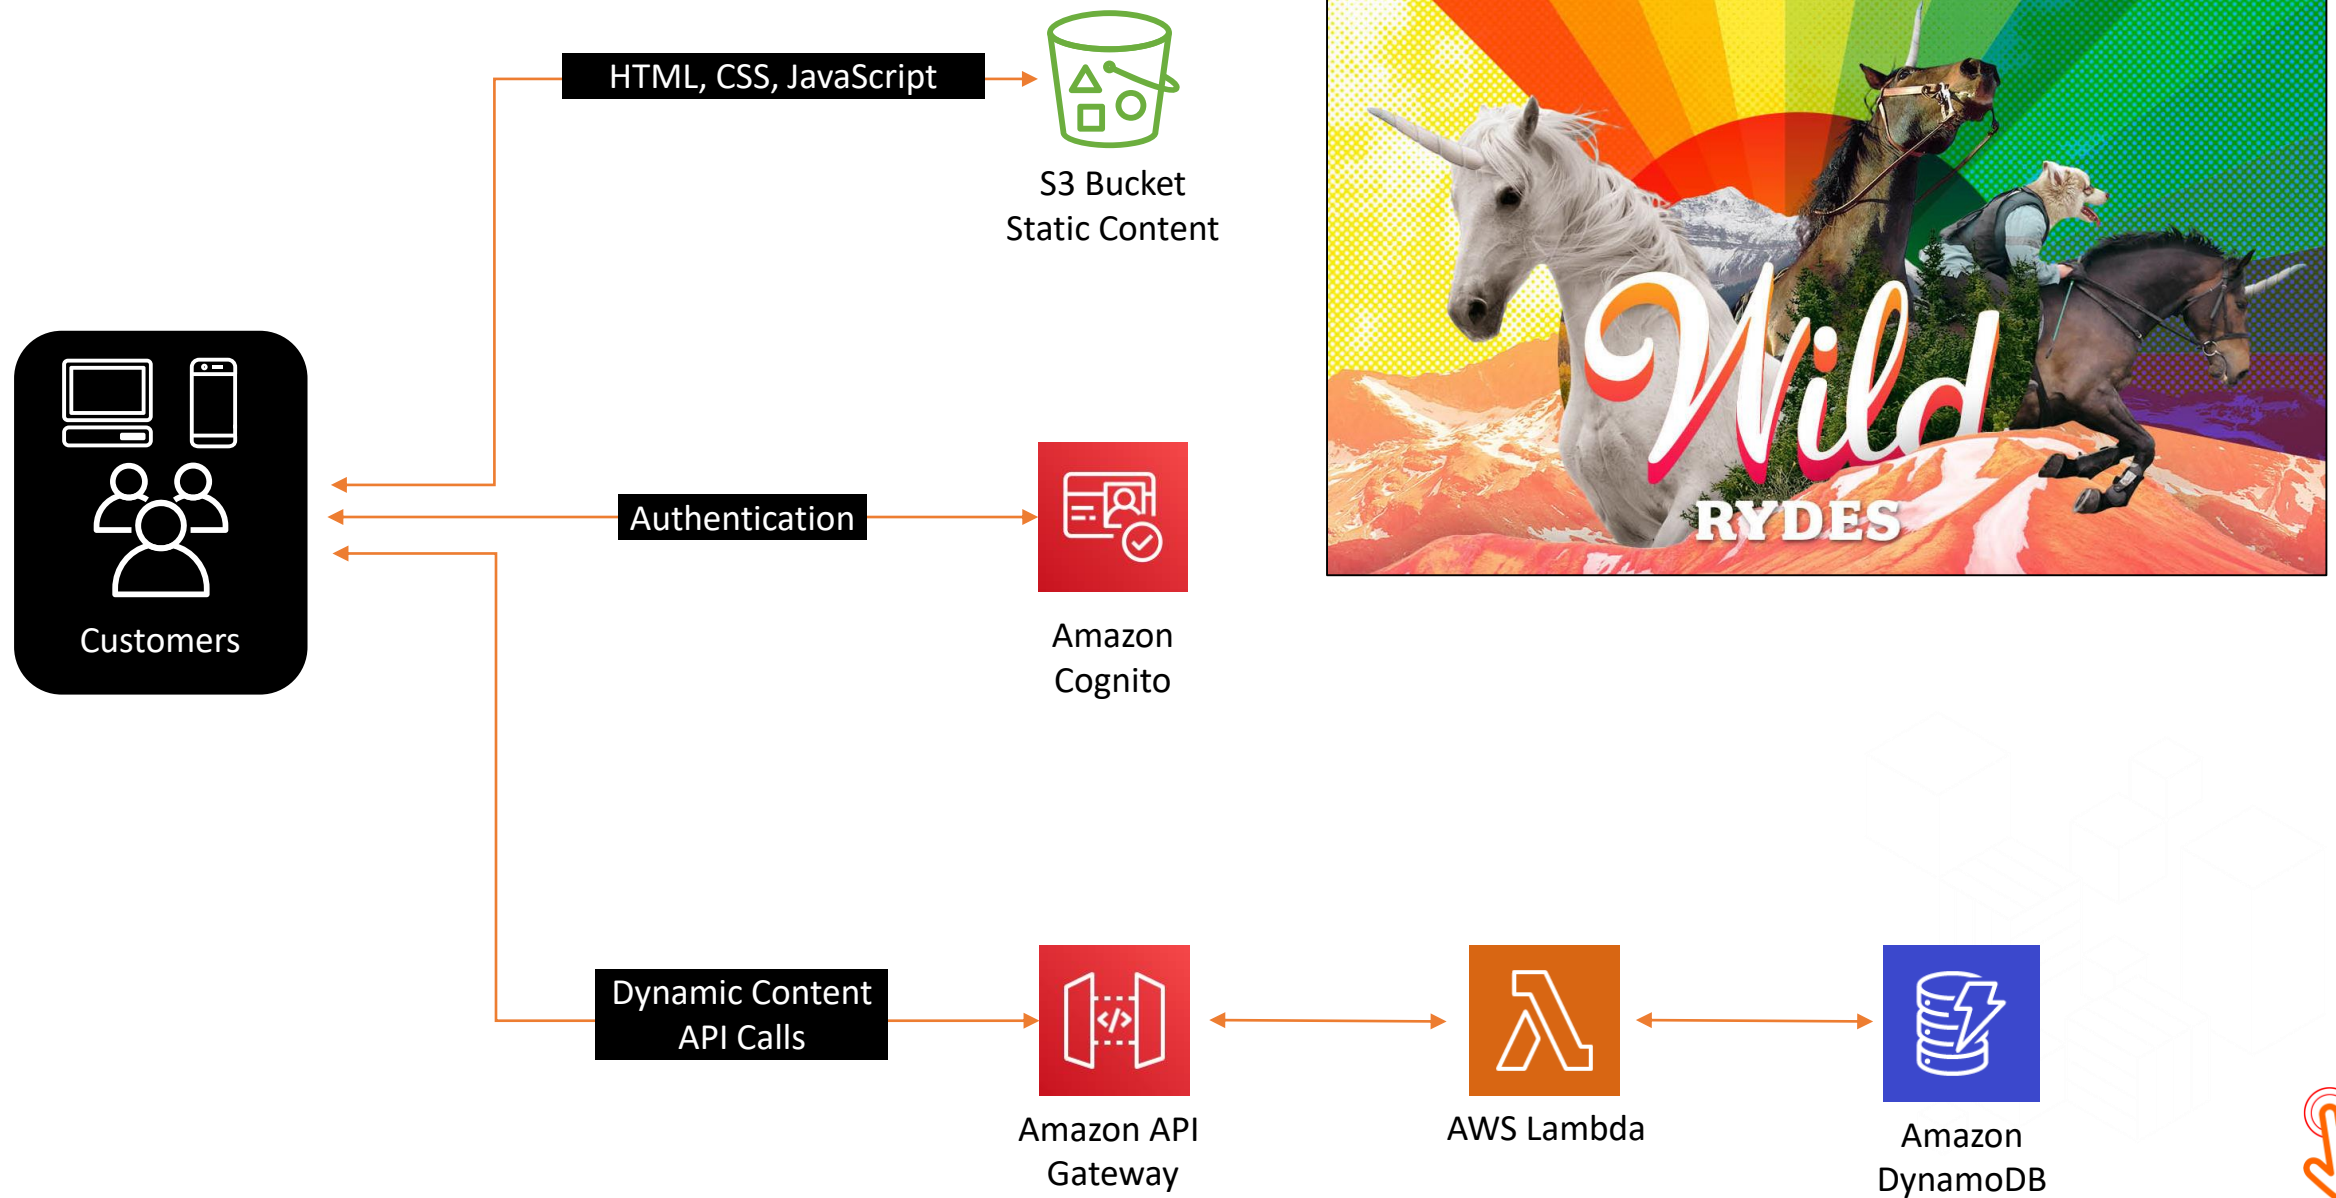

E-Commerce Application with API Gateway

E-Commerce Application with API Gateway using Microservices

AWS Project - Build a Serverless Web Application

Thank you for attending. See you next Saturday (2-July-2022)
